# BRIDGE STAR SYSTEMS SAFE TURNING AND REPOSITIONING

**BridgeStar System**, is a single patient use safe turning and repositioning system used by caregivers to safely manage a variety of frequent and strenuous patient handling tasks. The Star system will promote positive outcomes related to injury prevention and hospital-acquired pressure ulcers by creating a safe and efficient environment for both patients and staff.

The BridgeStar is available in both air and sheet systems. The system can include foam wedges and highly breathable absorbent protection pads. Both applications are available in a variety of sizes and options. To make ordering and inventory management simple, all items of the system can be purchased separately.

## Why BridgeStar Systems?

- ✓ **Injury Prevention** - Prevents injuries by significantly reducing the effort and forces required to perform lateral transfer and repositioning tasks
- ✓ **Wound Care** - Incorporates breathable materials allowing the system to be left in underneath the patient for high staff compliance when following turning and repositioning protocols. Eliminates sheering and friction
- ✓ **Sizing** - Available in multiple sizes to meet the needs of your patients and the environment to reach the highest compliance
- ✓ **Cost** - It's a small price to pay to prevent injuries and health-acquired pressure ulcers. When you compare it to other costly solutions, it makes sense for your budget
- ✓ **Versatile** - Effective in general Medsurg, OR's, Radiology, Cath Lab, Emergency, ICU's, Transport, and many other Departments and settings
